

LET'S MAKE A STREET LIGHT

CLUE

when you press the "space key", forever:

- If the aboard light sensor is below 300:
 - Turn on the aboard LED light green.
 - If not, all aboard LED lights must be turned off.

The image shows a Scratch script for a street light project. The script is as follows:

```
establecer el led de a bordo todos rojo 0 verde 0 azul 0  
al presionar tecla espacio  
por siempre  
  sensor de luz sensor de luz abordo  
  si entonces  
  si no  
establecer el led de a bordo todos rojo 0 verde 20 azul 20
```

The script starts with a block to set all board LEDs to off (0). It then triggers on the space key press. A 'forever' loop begins, checking the 'aboard light sensor'. If the sensor value is below 300, it turns the green LED on (20) and the blue LED on (20). If not, it turns all LEDs off (0).
